

WORKSHEET 1

How well do we know our planet?

The Miniature Earth tries to simplify the world population statistics, everything becomes a lot easier when we talk about hundreds instead of billions. By using World Health Organization, WorldBank, Census, United Nations, and other data, The Miniature Earth project shrank the world population stats down to just 100 people.

If the world population was only 100, what would it look like?

In your group consider the following questions and record your predictions:

How would the population be distributed?

How many people would be Asians, Europeans, Africans, Americans, Australians?

How many do you think would be hungry/malnourished?

How many can't read?

How many would have a secondary level education?

How many would own a fridge?

How many would own a bank account?

How many would have to survive on less than 2 euro a day?
